Experiment 3: Manage Complex State with React Context API

Aim: Establish a centralized application store for user authentication sessions, JWT tokens, and route protection using Context API.

Tech Stack / Concepts: Context API, createContext, useContext, ProtectedRoute, LocalStorage Persistence

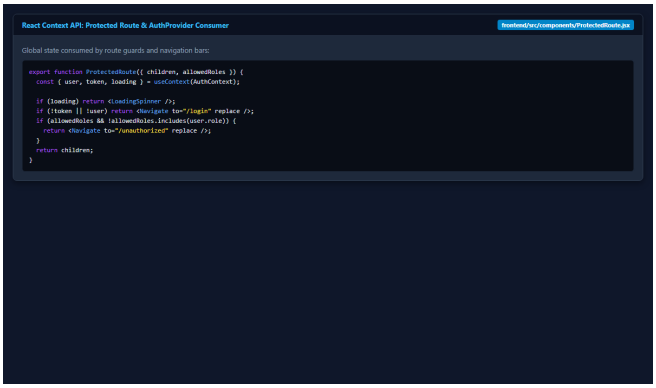

Repository: github.com/JaideepGowda2006/Certified | Student: Jaideep Gowda

Screen 1: Centralized User Login Form Interface

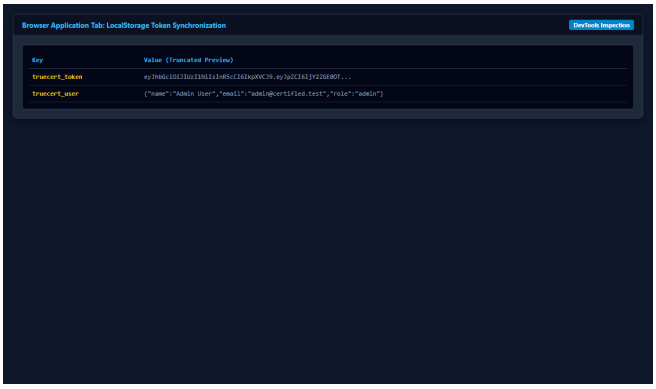

Form input bindings connected to AuthContext.login() action.

Screen 2: ProtectedRoute Guard Implementation

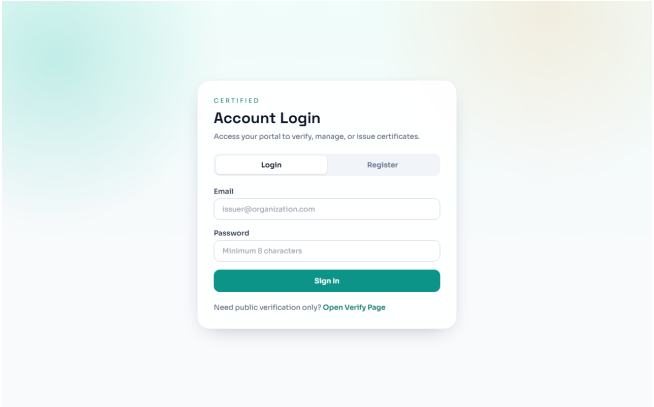

Global route protection redirecting unauthenticated visitors to login.

Screen 3: Browser LocalStorage State Synchronization

DevTools view showing synchronized truecert_token and user session object.

Screen 4: Authenticated Context State & Dashboard Access

Admin credentials granting elevated navigation options across components.
